THE 3 PAGES BOOK

Shortcut To Immortality

Who is the happiest person?

Are some people happier than others?

Does the effect of sadness and happiness on a person decrease after a while?

Remember the funniest video you've ever seen. Does it still make you laugh as hard as it did the first time? What about heartbreaking scenes? Are they always as shocking as the first time? Does this issue exist for other elements of life as well?

Many consider getting rich a long-term benefit, but is it really so? Do wealth and fame solve all problems? What happens when a famous and rich person becomes depressed or addicted? If you become very famous and rich, will you suffer from depression and addiction?

I'll ask a question and answer it a bit later, in your opinion, what percentage of people in the world are addicted?

Now that the statistics are discussed, let me draw your attention to some strange statistics:

Every 10 seconds, one to two people die from hunger and unhealthy food.

Nearly one billion people in the world are obese, and the number is constantly increasing.

More than a billion dollars are spent every day in the United States alone on various methods of weight loss and obesity treatment.

More than 700 million people in the world do not have safe drinking water. You have heard a lot about the war over water, while 71% of the earth is covered by water. It is a bitter irony, isn't it?

More than a billion dollars are spent every day on illegal drugs.

Hundreds of billions of dollars are spent annually on military equipment and forces.

Do you have any idea about the expenses related to entertainment, beauty procedures, and cosmetics?

Of course, I know that you probably have solutions in mind for most of these problems, but why aren't they used!

For a few moments, imagine a world where all the facilities are available for free to everyone, no one gets sick and no crime or accident occurs. You will probably have questions in your mind,

what kind of world it will be? So many ifs...

While you're daydreaming, I'll run through a few more shocking facts:

In 2023, there are people who sell their children due to extreme poverty, there are people who sell their body parts like the cornea and the heart, yes the heart! They sell it so that they can provide basic facilities for their family. Still, some people are killed for the most basic human rights, their eyes are blinded, and at best they spend long years in prison.

You may say that these issues don't happen around us, so you don't need to involve yourself in them. I ask you what if the solution to crises such as diseases, natural disasters, global warming, etc. is in the hands of one of these people who are currently busy with their most basic needs? In this case, their problems will be related to you as well.

Not so long ago, I never thought that many of the world's problems would plague me, but today I am among a lot of them, these problems are not as far away as you think!

Let me speak a little frankly, in developed countries, there are many problems related to security issues, terrorism and immigrants. The root of many of these problems is the colonialism and dominance of these countries themselves. What is the reason for hostile competition? Is there a lack of land and resources in this vast galaxy? Does it matter to the sun how many people it shines on? Don't you get 70 wheat from each grain? Perhaps the reason is that we have not progressed enough scientifically.

Many dangers threaten mankind, and I am not sure we have found an answer for all of them, such as natural disasters, pandemics, the impact of a celestial object, or even the invasion of aliens!

Why should we add other problems to this list, such as poverty, war, laboratory diseases, global warming, depression, addiction, etc.? Isn't it better to try to solve these problems first and give them a higher priority than sports events, movies and other entertainment?

Isn't it better to let scientists rule the world for a while instead of politicians? Isn't it time to change ineffective educational methods? Isn't it time for scientists to deal with the main problems of mankind instead of solving marginal problems? Isn't it time for a new order to be created?

Consider a family that does not have a shelter or food to eat. During the day, one member of this family spends a few hours of his or her time building a house and getting food, and the rest of the members spend most of their time having fun and resting. What do you think about this family? Aren't they all guilty, including that one working person who doesn't encourage others to help? Isn't this family similar to our human society?

To answer the question I asked before, I think all people have addictions! Some to drugs, some to alcohol, to computer games, to making money, music, sex, hunting, food, sports, social

medias, to complicating issues, dominance, to war and some others are addicted to making others addicted, maybe it is not bad for humanity to become addicted to science for a while, at least until finding practical answers to the problems that exist.

I'm talking to all people, whether it's the controlling few, the silent small group, or the majority busy with everyday issues: short-term benefits are attractive, but not permanent!

We are condemned to evolution!

If you believe that humans are the best creature in the world, you need to evolve to prove it, even if you are completely destroyed and evolve again.

And if you think that you are not the best creature in the world, you need to evolve for survival. This evolution will happen anyway, so why don't we or our children touch the result?

Compare the level of well-being a hundred years ago with now. In order to know about an event on the other side of the planet, a person had to travel long distances for days, but now news is transmitted in less than a second by the Internet. Imagine the next hundred years. What developments will occur?

This book has a message: we can speed up these developments with the right approach so that we can achieve the developments that are going to happen in the next hundred or two hundred years in less than thirty years. Maybe in the next two hundred years there will be a way to prevent death, but probably most of us will not live until then. On the other hand, most of us, or at least our children, will see the next thirty years.

Therefore, we have one way, and that is to use all human capacities, without regard to geographical boundaries, to speed up the solution of our main problems. To solving big problems, as a network expert, I guarantee that billions of average processors (brains), if properly managed, are much more powerful and efficient than a few hundred powerful processors. And if you ask me, "Do you know how to manage this network?" My short answer is positive.

So let's find each other and do a great right thing.
